Build	Some sprites seem to be missing around the house, as if the texture was not correctly loaded	
Build	I got stuck at the end of the tutorial, there was no screen or anything else, so I just had to exit the game. If this is a bug, it should be fixed, otherwise ensure that the player can proceed to the next level	
Build	The Settings menu is empty, if there is nothing to control there remove it	
Build	The sound of the monsters is terrifying enough as is, it doesn't need to be as loud as it is now	
Build	Same as with the tutorial, I got stuck at the end of Level 1 with no way to continue or go back	
Build	Are you supposed to be able to pass this spot in Level 2? Right at the beginning, to the left, I got stuck here and couldn't continue	
Build	Trying to press "Next Level" on Level 3 returns an error. If it is the last level of the game, have a screen that concludes the story and tells the player that they have won, and let them return to the main menu from there!	
Build	As it is now the game feels at times too punishing. There are monsters patrolling around the rooms on different patterns, but the player can only learn these through trial and error. You do have a good idea with the lamp extending mechanic to be able to see them, but it is too slow to grow and doesn't extend enough. Since there is a limited amount of times you can use the lantern as a player already as a thing limiting the player's abilities, I believe the game would benefit from making the lantern area growth much faster, so the player can catch more glances at enemy patrols	
Unity Project	There are some loose objects around the hierarchy in some scenes that are not grouped under others	
Unity Project	There are some lingering folders that are empty, like Resources. If unused, ensure to delete them	
Unity Project	There are some files not categorized around the project into subfolders, like some of the scripts lingering on the root of the "Scripts" folder	
Unity Project	There are redundant comments around your code, as well as debug messages. Debug messages should only be used when trying to debug something, they should not be polluting the console	
Unity Project	There are empty methods in some parts of the code, like in LevelResetOnReload, with an empty Update() method. Ensure that there are no empty methods in your code, they pollute the codebase	
Unity Project	The TutorialSpriteLocator is an empty MonoBehaviour with no functionality. Delete it if unused, and do the same with any other similar scripts
